

## Basic Command Lists of debian

apt-get: Advanced Package Tool, used for package management (installing, updating, removing software packages).

apt: A newer command-line interface for the APT package management system, introduced in Debian 8.

dpkg: Debian Package Manager, used for low-level package management (installing, querying, and removing individual .deb packages).

apt-cache: APT package management utility for querying information about available packages.

aptitude: An alternative text-based interface for package management, providing interactive package management capabilities.

ls: List directory contents.

cd: Change the current directory.

pwd: Print the current working directory.

mkdir: Create a new directory.

rmdir: Remove a directory.

cp: Copy files and directories.

mv: Move or rename files and directories.

rm: Remove files or directories.

touch: Create an empty file or update the timestamp of an existing file.

cat: Concatenate and display the contents of files.

more or less: View the contents of a file one screen at a time.

head: Display the beginning of a file.

tail: Display the end of a file.

grep: Search for patterns in files.

find: Search for files and directories in a directory hierarchy.
